FRENIC4600FM5e

FRENIC4600FM5e

AC Adjustable Speed Drive

Fuji Electric Co., Ltd.

Environment-friendly inverters.

Fuji medium-voltage IGBT inverter FRENIC4600FM5e is used for direct variable-speed control of medium-voltage motors, and greatly raises the efficiency and power factor, stabilizes motor operation and conserves energy.

Compact design for space saving

- The industry's smallest-class inverter achieved by significant panel size reduction

Ideal inverter for power sources and motors

- The multi-phase diode rectifier system reduces harmonics on the power source side.
- Due to the use of Fuji Electric's unique multi-level PWM control system, the switching surge is reduced and existing motors (standard ones) can be operated.

High-efficiency and high-power factor

- The use of a multi-phase diode, full-wave rectifier provides a high-power factor (95% or more) on the power source.
- The elimination of output transformers for operation has improved total efficiency (approx. 97%).
- Fuji Electric's original multi-level PWM control has reduced the IGBT switching loss.

10kV 1,200kVA

High-reliability

- Higher equipment reliability is achieved by reducing the number of inverter cells by using a single-phase, 3-level inverter, etc..
- Stable operation is maintained despite load fluctuations, by the simple sensor-less vector control function.
- The control device has a 32-bit MPU for quick response and high-accuracy.

Contributes to energy saving

- A substantial energy saving is achieved by variable-speed control of a square-law reduced torque load such as a fan or pump.

Vector control (option)

- Vector control with a speed sensor is available (as an option) for equipment having high speed and torque accuracy requirements.

Easy maintenance

- The inverter is air-cooled, requiring no cooling water.
- Start/stop operation, parameter setting, fault display and data monitoring are performed from the touch panel with simple loader functions.
- Simple, built-in auto-tuning functions facilitate testing and adjustment.
- Fault diagnoses are easily performed.
- A dry-type input transformer is adopted.

High-reliability and simple-maintenance inverters utilizing the latest power electronics such as 3-level inverter, mounting of special MPU and no need for harmonic filter/power-factor regulating capacitor.

Cooling fan

- Air-cooled inverters make maintenance easy.

Input multiplex-winding transformer

- Harmonic current on the power source side is low due to a multiplex configuration of the secondary winding.
- An equivalence of 36-phase rectification is effected, so harmonic current satisfies the standard level of IEEE.
- Harmonic filters and power factor improving capacitors are not needed.
- Because a dry-type input transformer is used in the panel, external cabling work between the input transformer and inverter panel is no longer necessary.

When requested, protection covers can be provided inside the inverter panel (as an option). Protection covers will protect from unexpected contact with live metal parts of the main circuit.

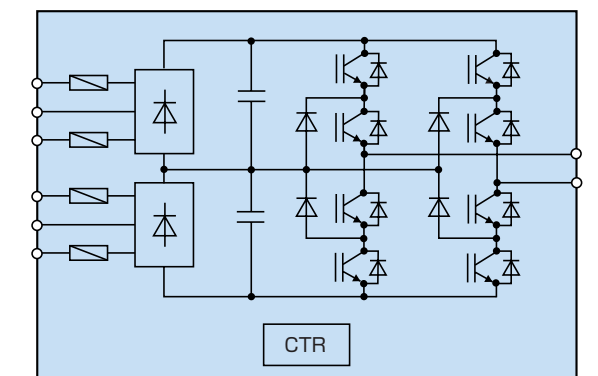

Master control PC board

- Mounting of a 32-bit MPU, and a special MPU in the voltage and current detection system offers a quick response and high accuracy.
- Incorporation of a simple sensor-less vector control function enables inverters to maintain stable operation irrespective of load fluctuation even without a speed sensor.

Inverter cell

- The number of inverter cells has been substantially reduced by adopting a single-phase, 3-level inverter design.
- Each inverter cell alone can be replaced easily, because the controller, diodes, IGBT elements and DC intermediate capacitor are combined into an integral body.

Clean power input

Substantial reduction of harmonic current on power source side

Due to progress in power electronics, semiconductors have recently been used for industrial electrical equipment and household electrical appliances in order to enhance convenience and ease of operation. However, due to harmonic currents generated from such equipment and appliances, the voltage of the power system is often distorted and many troubles occur in equipment connected to the power system. However, because the use of equipment containing power electronics will increase, measures for suppressing harmonics need to be improved.

FRENIC4600FM5e suppresses the harmonics by using a multi-phase diode rectification system (equivalent to 36-phase rectification), thereby substantially reducing the generation of harmonics in comparison with previous models.

The harmonic generation level stipulated in IEEE-519 (1992) is satisfied.

This inverter is ideal for power sources.

Total inverter efficiency as high as approximate 97%

- Because an output transformer is unnecessary, inherent losses are eliminated.
- Multi-level PWM control minimizes switching loss.
- Because the harmonic current on the power source side is reduced, the primary winding of the input transformer has a reduced loss due to the harmonics.

■ Total inverter efficiency curve (including input transformer)

Source power factor as high as 95% or more

- Due to full-wave rectification with multi-phase diodes, operation is allowed with the source power factor (power factor on power source side) set at a high level.
- A phase advancing capacitor and a DC reactor for improving the source power factor are unnecessary.
- A smaller power capacity suffices for inverter operation.

■ Source power factor curve

Note: The efficiency and power factor data on this page are calculated by assuming that a 315kW motor is operated at the rated speed with a 3.3kV-input, 390kVA-output inverter. The data on efficiency is obtained using Fuji Electric's standard 4-pole motor.

Friendly to machines

If a harmonic current component is contained in the inverter output current, a torque ripple occurs on the output shaft of a motor. A torque ripple means a change in rotational speed or a large vibration if the frequency of the torque ripple matches the natural frequency of the mechanical system and torque ripple is large.

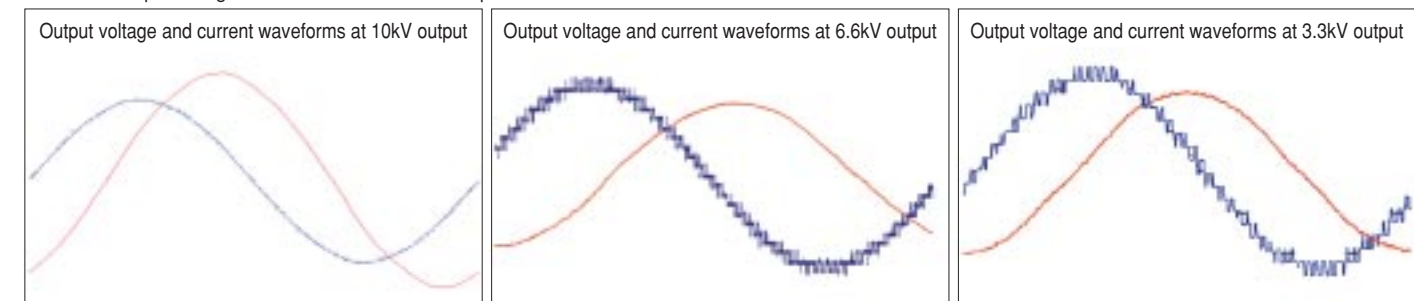

In FRENIC4600FM5e, the harmonic component on the output side is extremely small due to the multi-level (max. 21 levels) PWM control and the main component of torque ripple is at around the carrier frequency (several kHz). Therefore, torque ripple hardly affects the machine side.

Friendly to motors

- The multi-level PWM control provides an almost sinusoidal output current waveform, thus reducing motor torque ripple.
- Because the output current is almost sinusoidal, a motor suffers less loss due to harmonics.
- The multi-level (max. 21 levels) PWM control minimizes switching surge and thereby reduces stress on the motor.
- There is no need to reduce motor capacity due to inverter drive.
- There is no need for special cables, etc. due to inverter drive.

- This inverter is applicable not only to a square-law reduced torque load, but also to a constant torque load such as an extruder.
- For driving a large-capacity motor in a system that has a small power capacity, voltage fluctuation, etc. due to the starting current of a motor will cause problems. However, because the starting current can be suppressed by the soft start of this inverter, operation can be performed.

— : output voltage waveform — : output current waveform

Note

Surge voltage and multi-level output

The output voltage waveform of a PWM inverter is a DC chopping voltage (called "pulse voltage = surge voltage") whose amplitude is determined by voltage E_d of the DC intermediate circuit. When this surge voltage of inverter output is applied to a motor through a cable, the voltage is reflected repeatedly between the motor terminal and inverter terminal. A sharp overvoltage higher than the inverter output voltage is thus generated at the motor terminal, which may cause dielectric breakdown of the winding.

Fuji Electric's medium-voltage inverter suppresses the DC intermediate voltage level so as to realize an output voltage waveform at 21 levels in the 10kV class, at 13 levels in the 6kV class and 9 levels in the 3kV class. As a result, the overvoltage generated at the motor terminal can be suppressed.

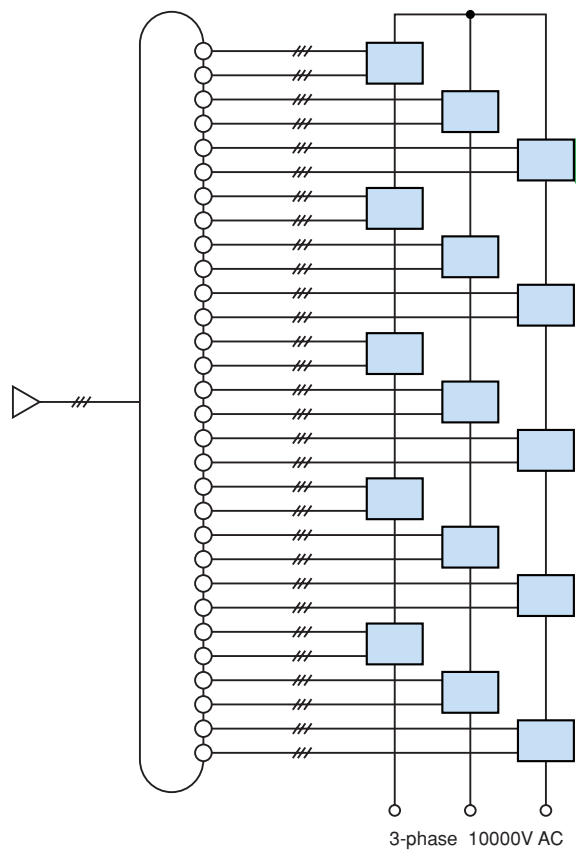

Output voltage waveform (21 levels) in 10kV class

In the 10kV class Fuji Electric's medium-voltage inverter, the output voltage changes in 21 steps (corresponding to 21 levels) within 1/4 cycle. The voltage value of one step equals the DC intermediate circuit voltage E_d . Therefore, for the same voltage output, a larger number of steps means a smaller voltage value at one step. Thus, Fuji Electric's inverter can also reduce the surge voltage appearing at the motor terminal and thereby moderate the stress applied to the motor.

Main circuit configuration

Fig. 1 Main circuit configuration of 10kV type

Principle of operation

FRENIC4600FM5e consists of an input transformer and 15 inverter cells in case of the 10kV type as shown in Fig. 1 (the 6kV type has 9 inverter cells and the 4.16 and 3kV types have 6 inverter cells.).

One inverter cell consists of a single-phase, 3-level inverter and can receive an output voltage of 1,155V.

As shown in Fig. 1, the 10kV type obtains a phase voltage of about 5,775V by connecting 5 inverter cells vertically and a

Fig. 3 3-level voltage output

Ed: DC intermediate circuit voltage

Fig. 2 Internal configuration of inverter cell

star connection of the vertical cell pairs can generate a line voltage of about 10,000V.

Use of the single-phase, 3-level inverter doubles the output voltage obtainable from one cell when compared with a single-phase, 2-level inverter. Therefore, an output voltage can be obtained by using a smaller number of inverter cells. (See Figs. 3 and 4.)

Fig. 4 2-level voltage output

Commercial power supply bypass circuit/restarting function after momentary interruption

- Shockless switching between inverter operation and commercial power operation allowed by phase control according to system voltage. (See Fig. 5.) (Synchronizing/parallel off function: option)
An electric reactor must be installed on the output side of the inverter to enable this function.

- Changeover to the starting circuit by commercial power supply can be made by installing a bypass circuit (option) on the inverter output side.

In this configuration, motor drive power supply is duplicated, and changeover between commercial power supply and inverter operation is allowed for running a motor at the rated speed. (See Fig. 6.)

- In the event of a voltage drop due to a momentary power interruption, the operation processing pattern can be selected according to the application.

1. Selection of major fault at voltage drop due to momentary power interruption

The inverter is stopped in the major fault status and the motor is set in the free run status.

2. Selection of restart under free run (option)

Inverter operation is stopped and the motor is set in the free run status. Upon power recovery, the motor under deceleration in free run or under stop is automatically accelerated again through a speed search function.

3. Selection of continuing operation at voltage drop due to momentary power interruption (option)

Inverter operation is continued without setting the motor in the free run status even when a voltage drop due to a momentary power interruption occurs. As soon as line voltage is recovered, the motor is accelerated again back to the operating speed.

Notes:

- (1) A voltage drop due to a momentary power interruption will be detected at 85% or less of the rated voltage.
- (2) Operation can be continued within 300ms at a voltage drop due to a momentary power interruption (option).

Other functions

- **Fault history**
Displays a chronological record of 100 faults with the cause and the date and time of occurrence.
- **Trip data display**
Displays the sampling values of internal data and bit data ON/OFF status in the event of a fault.
- **Save of set data, load, and comparison**
The set data can be saved in the EPROM of the touch panel. The saved data can also be loaded and compared with other saved data.

Large LCD touch panel (option)

This is a setting and monitoring tool for facilitating operation and monitoring on a 10.4-inch LCD.

Main functions of LCD touch panel

- Inverter start/stop
- Setting, change and indication of control parameters
- Bar graph display of actual value data
- Indication of fault cause (First fault/detailed indication)
- Trend display
- Test run, etc.

DDC loader for a maintenance tool (option)

Although maintenance and adjustment can be performed from the touch panel mounted on the panel face, an optional DDC loader is available as a maintenance/adjustment tool. The DDC loader using a notebook computer is easy to use because of its interactive mode.

Main functions of maintenance tool

- Setting, change, indication and saving of control parameters
- Running status display
Block diagram display, actual value indication, internal data listing
- Indication of fault cause
First fault, detailed indication, trace-back data
- Test run

FRENIC4600FM5e inverter operation promises substantial energy-saving and carbon dioxide reduction.

In air-conditioning or pumping facilities, fans or pumps typically run at a constant speed even when the load is light. Adjustable speed control according to the load (air or liquid flow) through inverter operation greatly reduces energy consumption and maintains the maximum possible motor efficiency even at low-speed operation.

Liquid flow and power characteristics

Example of application and energy-saving effect

The following example compares constant speed motor operation with valve (or damper) control, against inverter adjustable speed control operation, and shows the electric power saved.

● Example conditions for calculation

Motor output:
1,000kW, for annual operation time 4,000 hours
Operation pattern:
85% flow for 1/2 of overall time (2,000 hours)
60% flow for the remaining half (2,000 hours)

● Constant speed operation of motor (with valve control)

At 85% load of liquid flow (Q)
Required Power (P) = 91% × 1,000kW = 910kW
At 60% load of liquid flow (Q)
Required Power (P) = 76% × 1,000kW = 760kW
Annual power consumption
910kW × 2,000h + 760kW × 2,000h = 3,340,000kWh

● Inverter operation (adjustable speed control operation with inverter)

At 85% load of liquid flow (Q)
Required Power (P) = 61% × 1,000kW = 610kW
At 60% load of liquid flow (Q)
Required Power (P) = 22% × 1,000kW = 220kW
Annual power consumption
610kW × 2,000h + 220kW × 2,000h = 1,660,000kWh

● Annual energy-saving

3,340,000 - 1,660,000 = 1,680,000kWh
(energy-saving = about 50%)
Carbon dioxide reduction = 635,040kg

Options

Field Web adapter (plusFSITE)

plusFSITE

This adapter enables users to carry out remote monitoring of inverters promptly and easily with their own personal computers without using a dedicated system.

Main features

- Web server function
Inverters can be monitored from the browser of a personal computer. (Display screen can be changed if requested.)
- Mail sending function
Actions can be reported periodically from inverters.
- Installation and wiring both easy
 - A small and lightweight structure mountable on the front of the inverter panel
 - Connectable with the loader connector of an inverter (RS-232C interface)
 - Connectable with personal computers through LAN cable (IEEE802.3 10BASE-T)
- Equipped with a 32-bit RISC chip/real-time OS μITRON
- Protocol converting function
(Changeable from RS-232C to LAN)
- The corresponding drive unit is applicable to the FRENIC4600FM5e and other products of Fuji Electric.

LCD touch panel

The touch panel offers the following key loader functions:

- Start and stop of inverter
- Setting, change and display of control parameters
- Fault data display and fault resetting
- Data monitoring (LED display)

The contents of the above data are displayed on the LCD.

DDC loader

A loader using a notebook personal computer is available. The easy-to-use interactive type of loader offers the following functions.

- Start and stop of inverter
- Online setting, change, display and printing of control parameters
- Fault resetting
- Trace-back data
- Fault data display and printing
- Data monitoring

Analog output unit (AO unit)

Data can be output in analog mode during operation. Output data can be freely selectable among about 100 items by operating the touch panel.

Lifter

Application	Series	Features	Output voltage [V]	Capacity range [kVA]			
				10	100	1000	10000
For plant	FRENIC 4000VM5	Vector controlled inverter for plants • High-performance vector control system for quick response, high-accuracy and wide range speed control. • The DC-link system allows highly efficient plant operation.	400				5400
	FRENIC 4000FM5	V/f controlled inverter for plants • Frequency of fan, pump and group-driven motors can be controlled accurately. • The DC-link system allows highly efficient plant operation.	400				900
	FRENIC 4400VM5	Large-capacity vector controlled inverter • The capacity of FRENIC4000 series units has been increased due to 3-level control.	800				6000
	FRENIC 4400FM5	Large-capacity V/f controlled inverter • The capacity of FRENIC4000 series units has been increased due to 3-level control.	800				2000
	FRENIC 4700VM5	Medium-voltage large-capacity vector controlled inverter • The capacity of FRENIC4000 series units has been increased thanks to the series-connected device and 3-level control.	3440				7800
	FRENIC 4800VM5	Medium-voltage, water-cooling, large-capacity and vector controlled inverter • The capacity of FRENIC4000 series units has been increased due to 3-level control. • Downsizing achieved by adopting a water-cooling system	3100				24000
For general industry (medium-voltage)	FRENIC 4600FM5	Medium-voltage direct-output inverter • 3.3/6.6kV IGBT inverter • Variable speed operation of medium-voltage motors saves energy. • Circuit configuration and control are well designed for power supplies and motors.	3300				3750
			6600				7500
	FRENIC 4600FM5e	Medium-voltage direct-output inverter (for fans and pumps) • Compact • Variable speed operation of medium-voltage motors saves energy. • Circuit configuration and control are well designed for power supplies and motors.	3000/3300 4160 6000/6600 10000				4750/ 5200 2200 9500/ 10500 5300
For general industry (low-voltage)	FRENIC-VG	High-performance vector controlled inverter	200 400				90kW 800kW
	FRENIC-MEGA	High-performance V/f controlled inverter	200 400				90kW 630kW
	FRENIC-ECO	V/f controlled inverter for fans and pumps	200				110kW
			400				560kW

Selection of inverter capacity

When selecting inverter capacity, select an inverter whose rated current value is larger than the operating current of the motor to be driven.

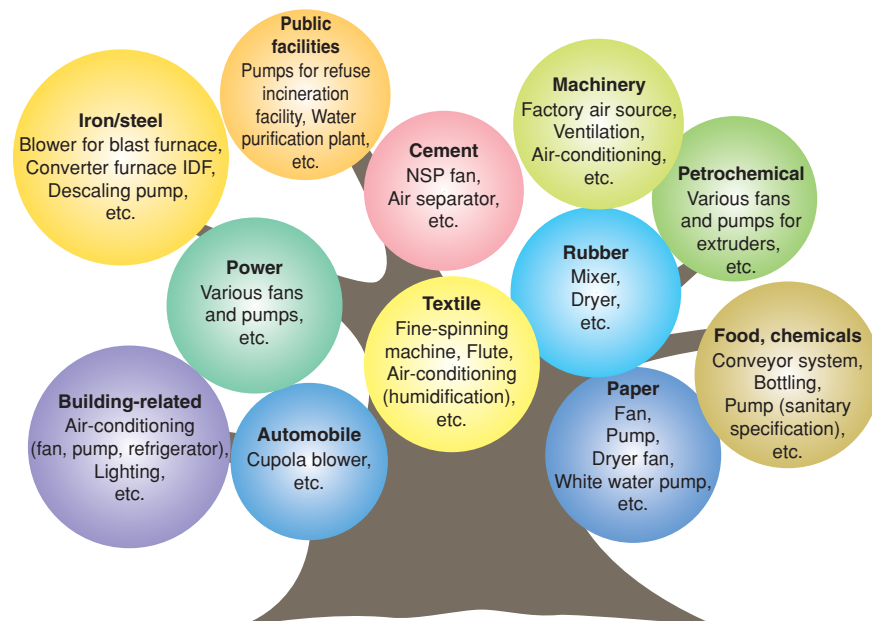

● Selection example 1

For driving a 6kV, 50Hz, 315kW, 4-pole motor:
Rated current value of motor: 38A
Operating current value of motor: 38A
→ Select an inverter capacity of 420kVA (41A).
(38 < 41A)

● Selection example 2

For driving a 6kV, 50Hz, 630kW, 4-pole motor:
Rated current value of motor: 75A
Operating current value of motor: 56A
→ Select an inverter capacity of 600kVA (59A).
(56 < 59A)

Examples of applications

FRENIC4600FM5e (6.6kV 10,500kVA(*))
